IISER Tirupati.

INTERVIEW – 1 (A)
SUSTAINABLE- ARCHITECHTURE

On 29th May, Prakriti Club (The conservation club of IISER-Tirupati) had the opportunity of conducting a written interview with **Ms. Bhavya**, Associate Professor, MM School of Architecture, MMU, Sadopur-Ambalal, Punjab, India.

The written interview questions were prepared by Nithish.G.S (Prakriti club member) and the interview was conducted by Anchita Sharma (Prakriti club member). Through the answers, we got a new perspective about sustainable architectural designs existing in the world! The interview:

What are current trends in sustainable architecture and green building projects amongst the architects?

Orienting the building on the site in such a way that wind flows through nature is an efficient way of ventilation with minimal or no air conditioning systems. With the help of architectural elements like sun shading devices and wing walls, passive design can open new possibilities to achieve low-cost construction. Architects these days usually prefer designing environment friendly building by using various techniques, some of which I have mentioned above.

How developing countries like India are foreseeing the possibility of sustainable architecture and green buildings?

India has been on the forefront of change, including the 2006 National Environmental Policy, which targeted a host of challenging issues including pollution, waste management and energy, and the 2008 National Action Plan on Climate Change which focused on the critical balance between economic development and climate change.

Which world countries are encouraging sustainable designs and welcoming innovative architecture projects (from the current generation architect community's point of view)?

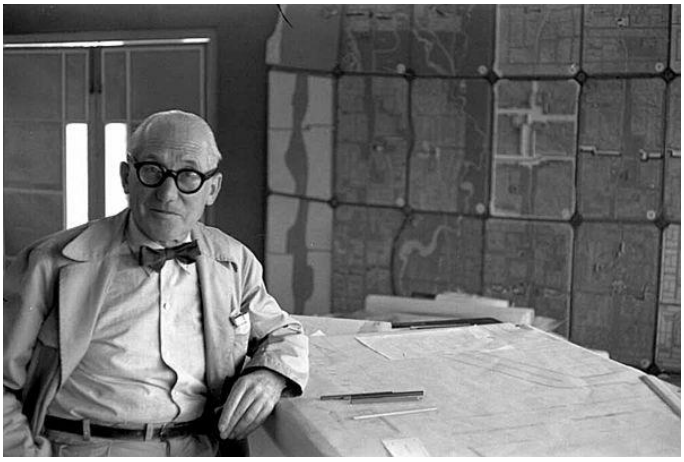

Singapore has emerged as a model of green building for planners and developers across much of the Asia-Pacific region, where poor design reigns and developers have historically seen little incentive to invest in sustainability, according to Asia-based architects and sustainability experts. Singapore's BCA (Building and Construction Authority) is now marketing its rating tool 'Green Mark' as a brand in Southeast Asia, China, and parts of tropical Africa — even in countries, such as neighboring Malaysia, where local rating tools offer competing certification systems.

The awareness about green buildings in metropolitan cities (from an aspiring architect's point of view)?

There are very few green buildings under construction and these few buildings could be a source of awareness. Understanding the level of awareness, perceptions and attitudes of artisans, communities and professionals on green building practices provides a good baseline on which to disseminate information on green building technology.

Various efforts are going on to educate humankind about green buildings and in metropolitan cities people are appreciating the thoughts and even trying to use it in day-to-day life.

Your personal inspiration when it comes to sustainable design and his/her major contribution?

Source: ENGEL & VOLKERS

My inspiration is Architect Le Corbusier who designed the Chandigarh city.

Watch Video: Le Corbusier's model city of Chandigarh.

Your final comments about the future of sustainable architecture and green buildings?

Sustainable architecture is at the front and center of new green building and renovation projects around the world. It has the potential to significantly benefit both the humans who occupy urban spaces and the surrounding environment.

Now, architects and buildings are expected to be engaged with sustainable standards, such as LEED (Leadership in Energy and Environmental Design) titles, photovoltaic cells, or green roofs—all things that these projects have in common.

……. THE END……
